

Selection and Evaluation of a Framework for Interoperable Freshwater Modelling

Alexander Elliott, Gabriella Turek
Valerie Snow

Daniel Rutledge, Alistair Ritchie, Alexander Herzig

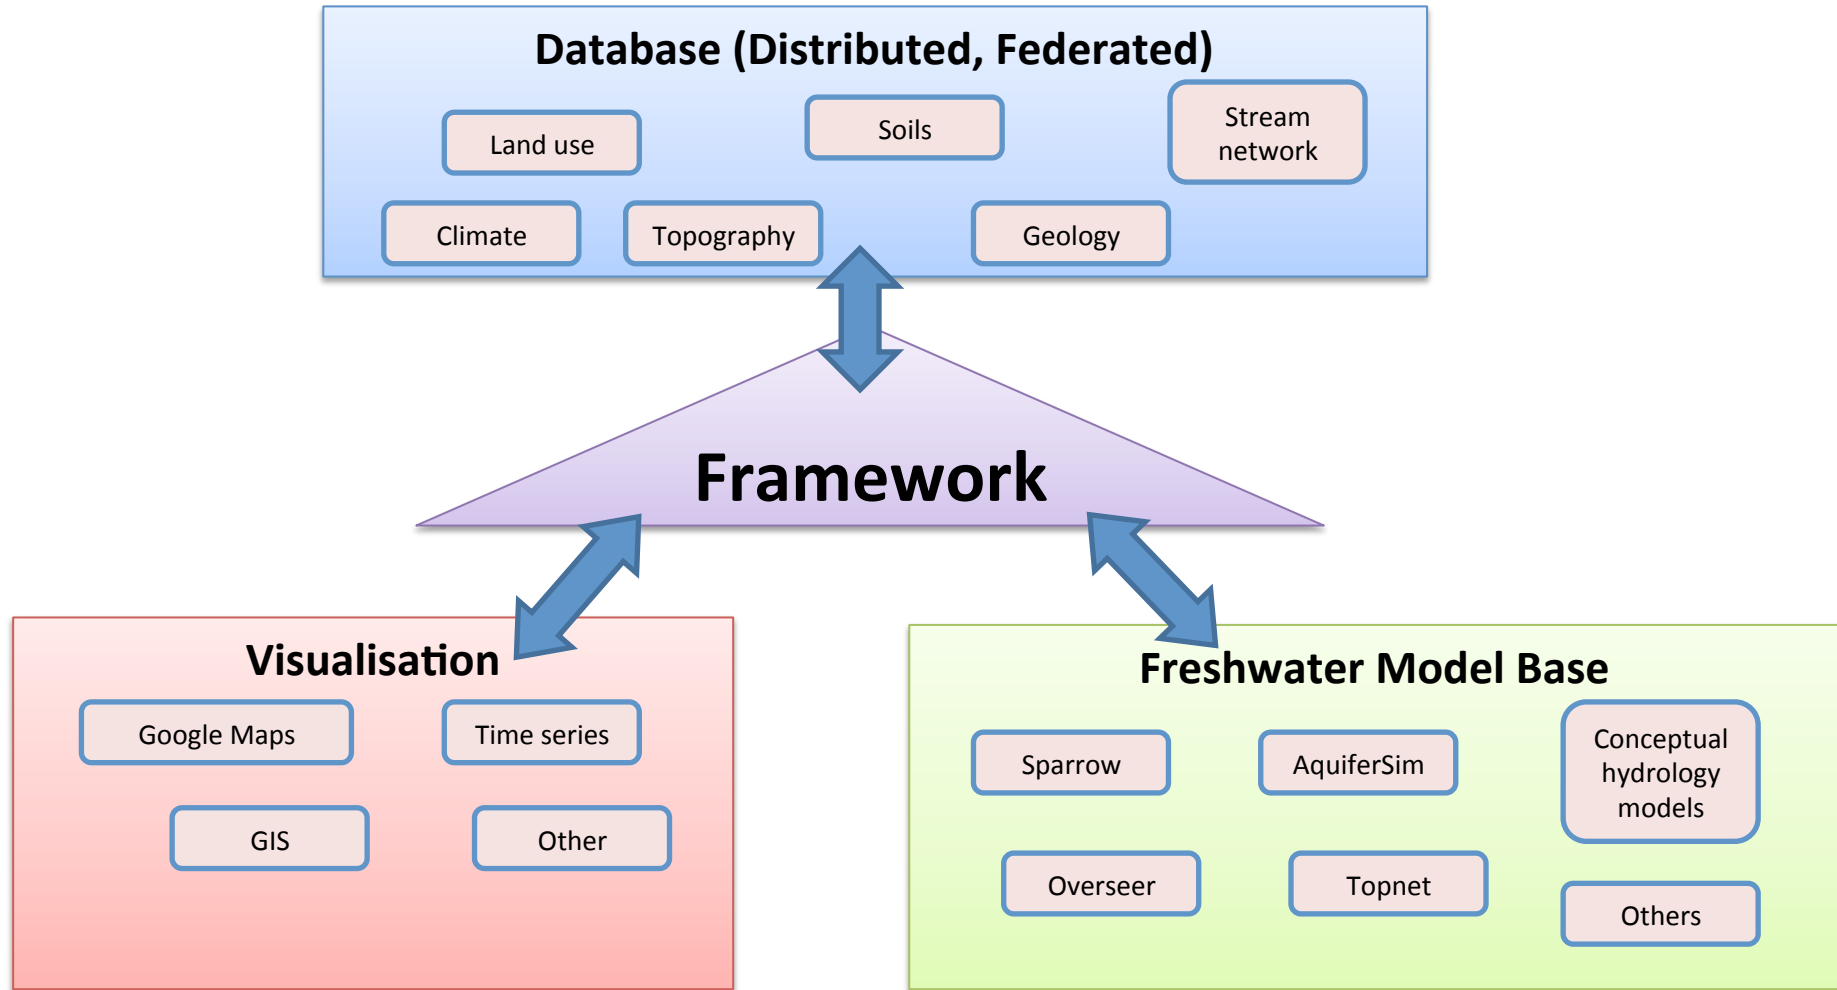

The motivation

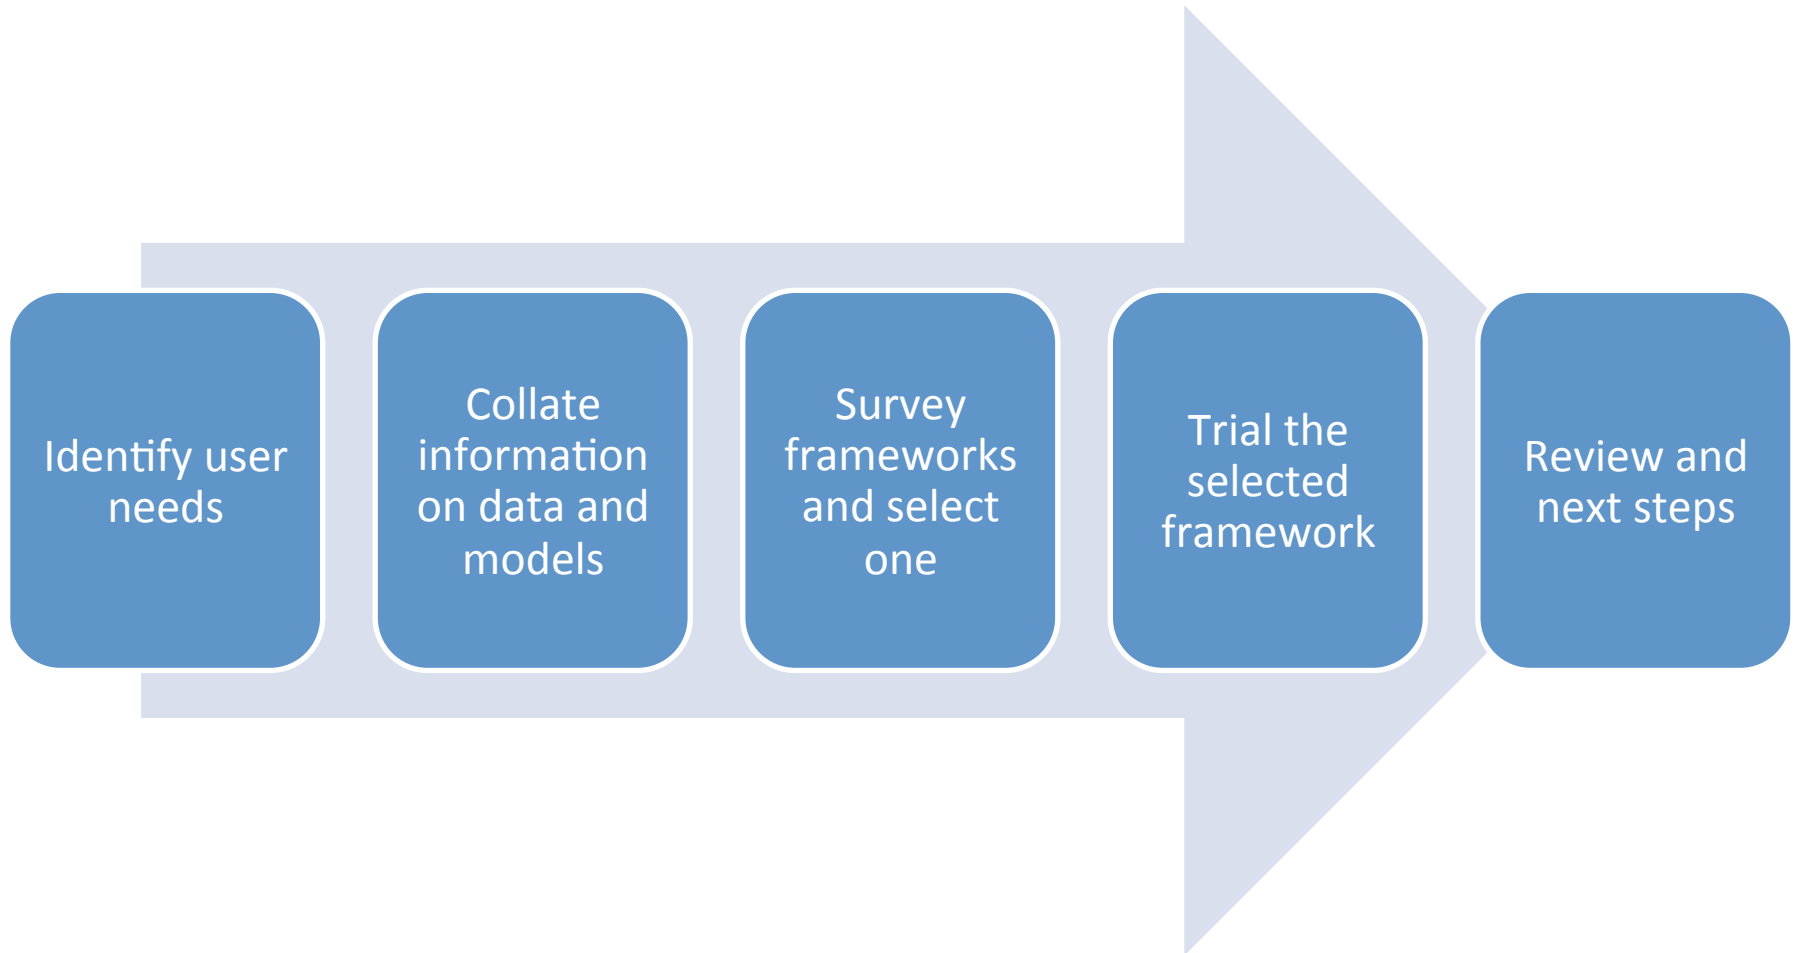

- Better organisation and linking of freshwater models in New Zealand
- Better use of environmental datasets
- *“robust interoperable models to assist the development and implementation of freshwater policy and management” (MfE)*

Our original view of a framework

Stages of our investigations

Identify user
needs

Collate
information
on data and
models

Survey
frameworks
and select
one

Trial the
selected
framework

Review and
next steps

Expected benefits of a framework (identified in user workshop)

- Efficiency of model use
- More robust model estimates
- Transparency of how models are used
- Better and more timely policy and regulatory decisions
- Decreased costs of model provisioning
- Answer more complex questions

Classes of framework user

Indirect Users

Interpreters

Direct Users

Developers

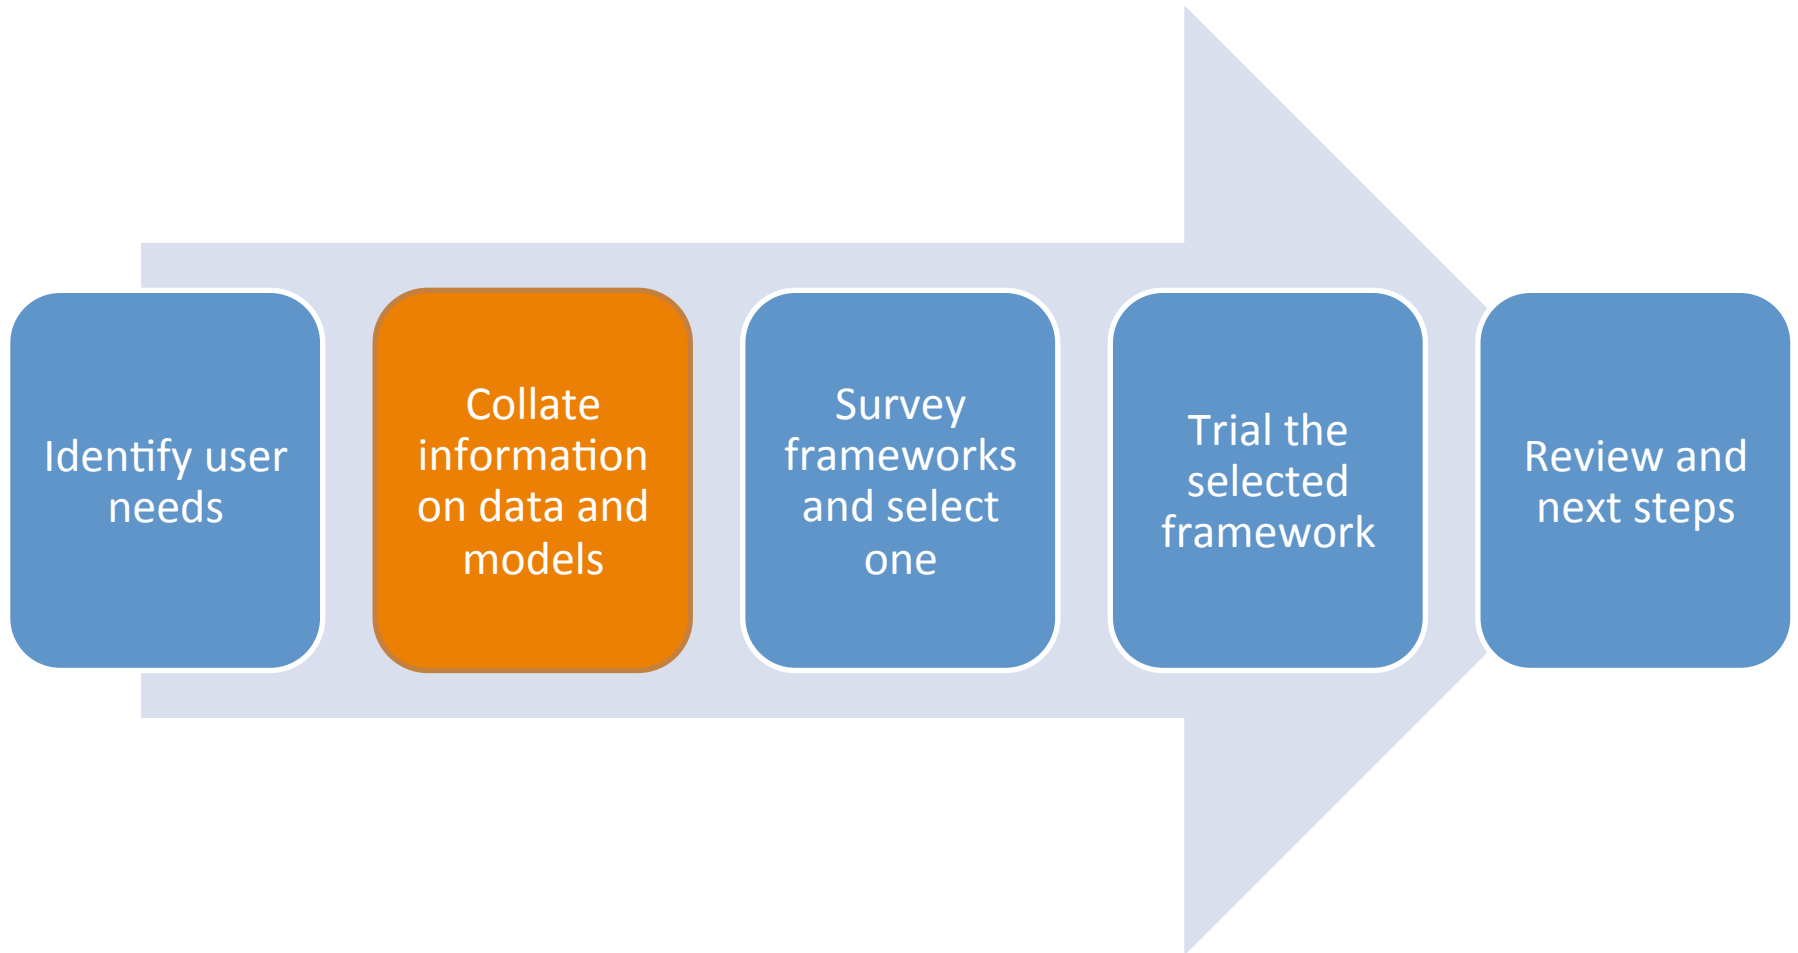

Criteria for framework selection

33 identified, 13 key

Key Criteria

1. Previous model/data/parameter assemblages can be stored and re-run
2. Supports dynamic models
3. Supports static models
4. Can add/remove/substitute components, not a fixed assemblage
5. Framework software is open-source and non-proprietary
6. Framework is available for anyone to use at low or nil cost
7. Uses open standards for model interfaces
8. Uses open standards for data
9. Can work at a range of spatial scales
10. Supports spatial models
11. Supports geospatial data
12. Continuity and good prospects of longevity
13. GUI for configuring and setting up models

Title	Description	Biophysical Domain
APSIM	APSIM is internationally recognised as a highly advanced simulator of agricultural systems. It contains a suite of modules, or components, which enable the simulation of systems that cover a range of plant, animal, soil, climate and management interactions. It is undergoing continual development, with new capability added to regular releases of official versions over time. Its development and maintenance is underpinned by rigorous science and software engineering standards.	Soil-plant-
AquiferSim	AquiferSim is a GIS-based steady-state regional scale groundwater flow and contaminant transport model. It was developed as part of the multi-organisation IRAP (Integrated Research for Aquifer Protection) Project.	Groundwa Other
BNZ	Catchment-scale water quality model for sediment and nutrients. The daily USDA GLEAMS model is run for each unique grid cell and contaminant are then routed to the stream and down the stream network with attenuation.	Soil-plant- Streams a rivers
C-CALM	Catchment Contaminant Annual Loads Model Urban water quality model with a GIS platform (ArcMap - versions available for 9.3 and 10) which estimates the annual loads of TSS, zinc and copper (total, dissolved and particulate) generated by different land covers at the stormwater catchment scale. Based on the Auckland Council spreadsheet CLM model and has the same choice of land covers which represent different landuses and yields for those covers. Allows users to choose between a range of stormwater treatment options and the proportion of each land cover treated to reduce annual loads. Available on request from NIWA.	Streams a rivers, Est
CESIT	Linked catchment and estuary sediment deposition model. Includes a user interface. Mean annual sediment yields are predicted as a function of land use, soils, rainfall, and mitigation measures. Resulting loads decomposed into a time series which is fed to an event-based estuary dispersal model.	Soil-plant- Streams a rivers, Coa
CLUES (Catchment Land Use for Environmental Sustainability)	CLUES is a catchment model developed to address implications of land use scenarios on stream water quality and some socio-economic indicators.	Soil-plant- Streams a rivers, Lak Integrated
Delft3D	3D hydrodynamic model for rivers, estuaries and coastal seas. Includes sediment transport, and optional water quality components. Incorporates SWAN wave model. Includes morphological change in response to sedimentation.	Other
DHSVM	DHSVM is a distributed hydrological model that explicitly represents the effects of topography and vegetation on water fluxes through the landscape.	Soil-plant-

Organise models according to attributes

I/O items used to identify potential linkages

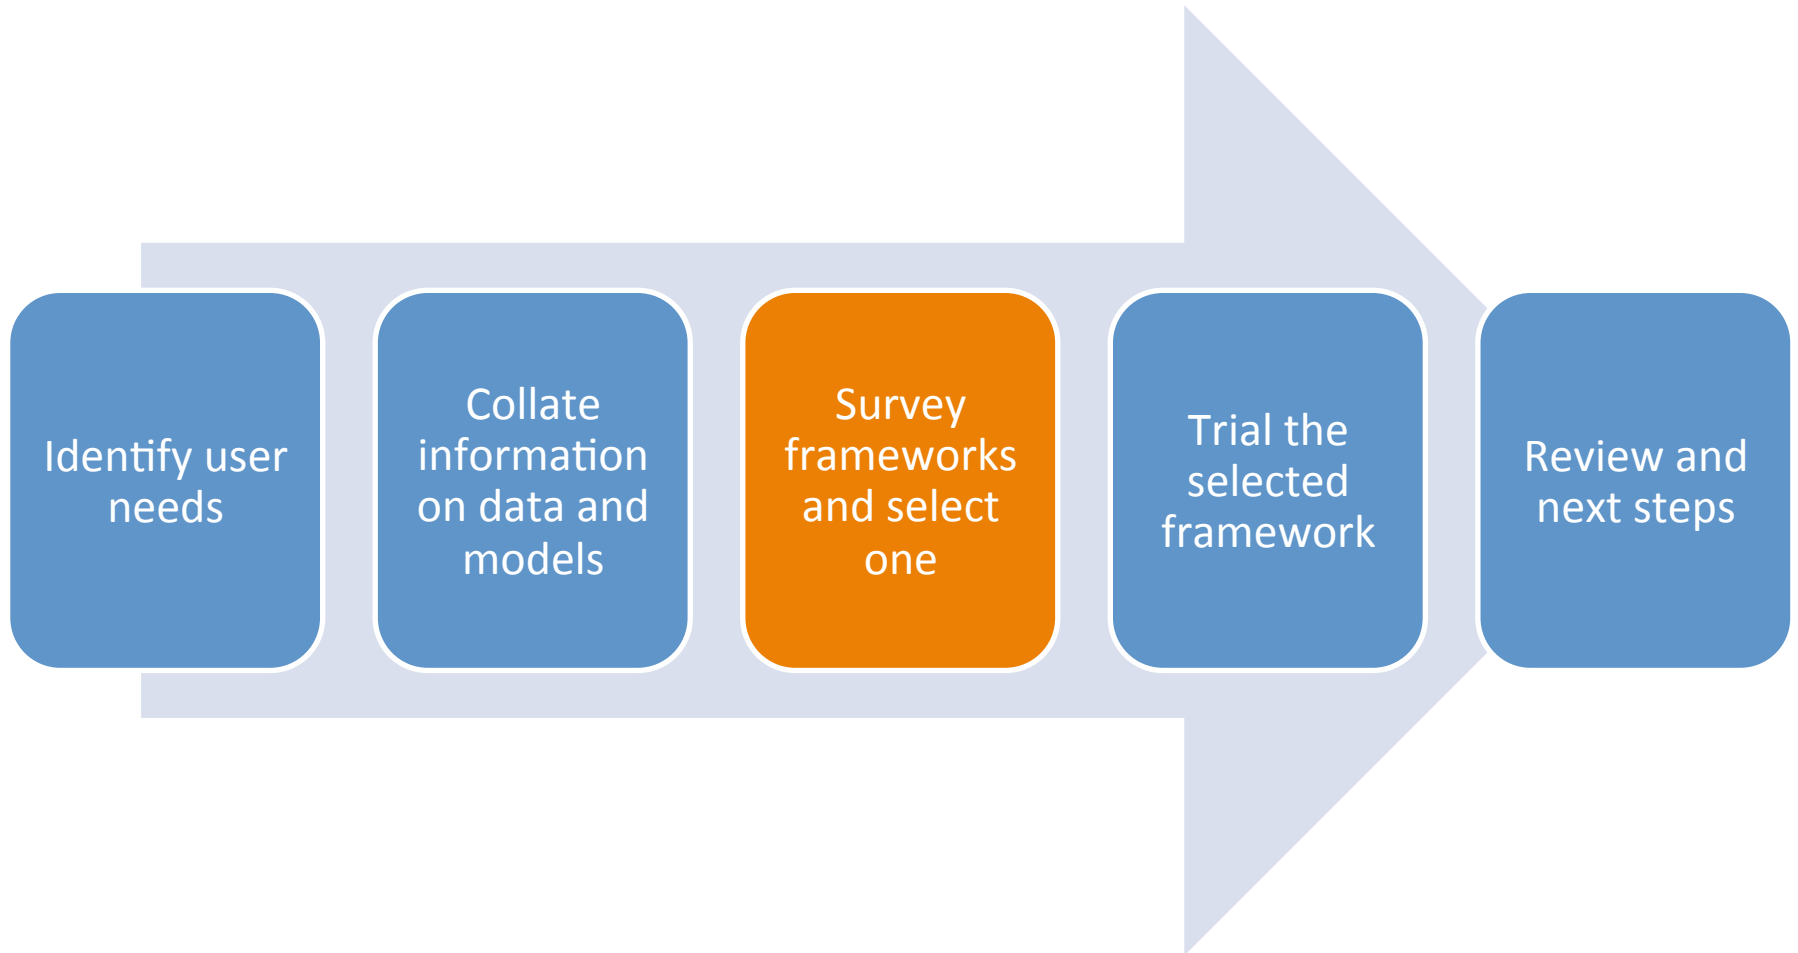

Potential linkages: ModelVis

The screenshot displays the IFM ModelVis (beta) software interface, which is used for visualizing and managing model linkages. The interface is divided into several panels:

- Model Filter:** Contains tabs for Domain, Inputs, and Outputs. Under the Domain tab, there are sections for Management (Atmosphere, Soil Plant Animal, Ground water, Streams and Rivers, Lakes, Estuaries, Coastal, Integrated, Other), FreshWaterDomain (Nitrogen, Phosphorus, Microbes, Sediment, Generic, Other), and ScienceDomain (Point, Med Large Catchment, Field Hills lope, Farm Small Catchment, Regional National, Field Reach, Other).
- Model List:** A list of models sorted by Name. The list includes: FarmMonitProg, GGD, GLEAMS, GWQual, HEC-RAS, HEM, Hydrus, IDEAS, IFS, IRRICALC, LCDB2, LCDB3, LENZ-Class, LENZ-Under, LINZ, LRI, LUCAS, LURNZ, LakeWaterQual, MODFLOW, Mike11, NGMP, NHD, NManager, NRWQN, NSD, NVS, NZEEM, Overseer, PAN-NZ, PETLAB, PPNVNZ, QMAP, REC, ROTAN, RiverWaterQual, SHETRAN, SPARROW, SPASMO, SSYE, SWAT, SedNet, and SoilVulMod.
- Input/Output Graph:** A central diagram showing the flow of data between models. A central green box labeled 'Overseer' is connected to a vertical column of models on the left (APSIM, IRRICALC, LURNZ, SPASMO, VIEPP, Agribase, AgricProdSurv, CC-Info, EcoSat, FarmMonitProg, FSL, LCDB2, LCDB3, LENZ-Class, LRI, LENZ-Under, and Ciflo) and a vertical column of models on the right (AquiferSim, CLUES, IDEAS, IFS, MODFLOW, ROTAN, and SPARROW).
- Super Model Component Models:** A diagram showing the relationship between SPASMO, SoilVulMod, SPARROW, and CLUES. SPASMO and SoilVulMod both point to SPARROW, which then points to CLUES.
- Model Information:** Contains a 'Wiki Link Overseer' section, a description of 'Overseer (Super-model)' as a model for farm-scale nutrient budgeting, and sections for States (Steady State), Domains (Management, Fresh Water, Soil Plant Animal, Nitrogen, Phosphorus), Inputs (Climate Data, IrrigAmt, Soil Name Map, Soil Hydraulic Prop, Landuse Type Map, Crop Stock TypesAttrib, Crop Stock Production, Crop Stock Management), and Outputs (Drainage, Nutrient Leach).

Stages of our investigations

Targeted Tests

Feature being tested	Specific Test
Set up point-scale dynamic model	Set up Watyfield hydrology model
Get temporal input data from a web service and link to a model	SOS web service for climate data into WatYield
View model results	Watyfield time series using using JFreeChart
Link to spatial data provided as web service	Get land cover and climate input from an OGC-compliant web service using wget requests
Manipulate spatial data	Use GDAL processing libraries to manipulate spatial input to Watyfield
Set up and run a spatial model	Run Watyfield point model over a grid
Set up legacy models from various formats	Overseer leaching model as dll's and web service. Fortran Sparrow model. Watyfield from VB6
Develop simple user interface	Editor to manipulate fields in Overseer XML files and run modified model
Link models	Overseer -> Catchment model
Use components from other frameworks	Use APSIM components

WATYIELD OMS3 Screenshot

        @Override
        public void windowClosing(WindowEvent evt)
        {
            System.out.println("Bye!");
            System.exit(0);
        }
    }
)

```

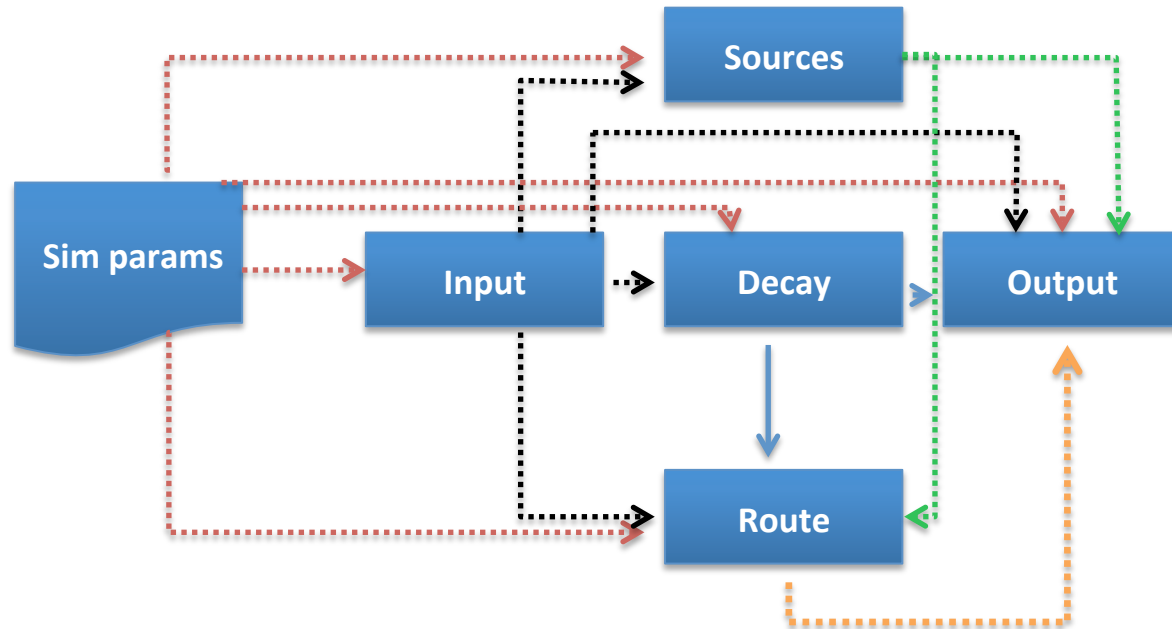

A dialog box titled "Overseer6 Input Editor" with a standard Mac OS window title bar (red, yellow, green buttons). The dialog contains a menu bar with "File". Below the menu bar, there are three sections: "Animals", "Structures", and "Fences". Each section has a label and a text input field. The "Animals" section has "Chickens" with the value "6" and "Pigs" with the value "2". The "Structures" section has "Paddocks" with the value "5" and "Fences" with the value "7". At the bottom of the dialog are two buttons: "Reset" and "Save".

Category	Item	Value
Animals	Chickens	6
	Pigs	2
Structures	Paddocks	5
	Fences	7

reenSize();

Linking data and models

Positive results from OMS3 trialling

- Fairly easy to set up and link models
 - Fortran, porting code to Java, simple .NET dll's
- Can set up components for:
 - visualisation
 - access to data sources
 - simple user interface
 - geospatial data manipulation
 - access to models as a web service

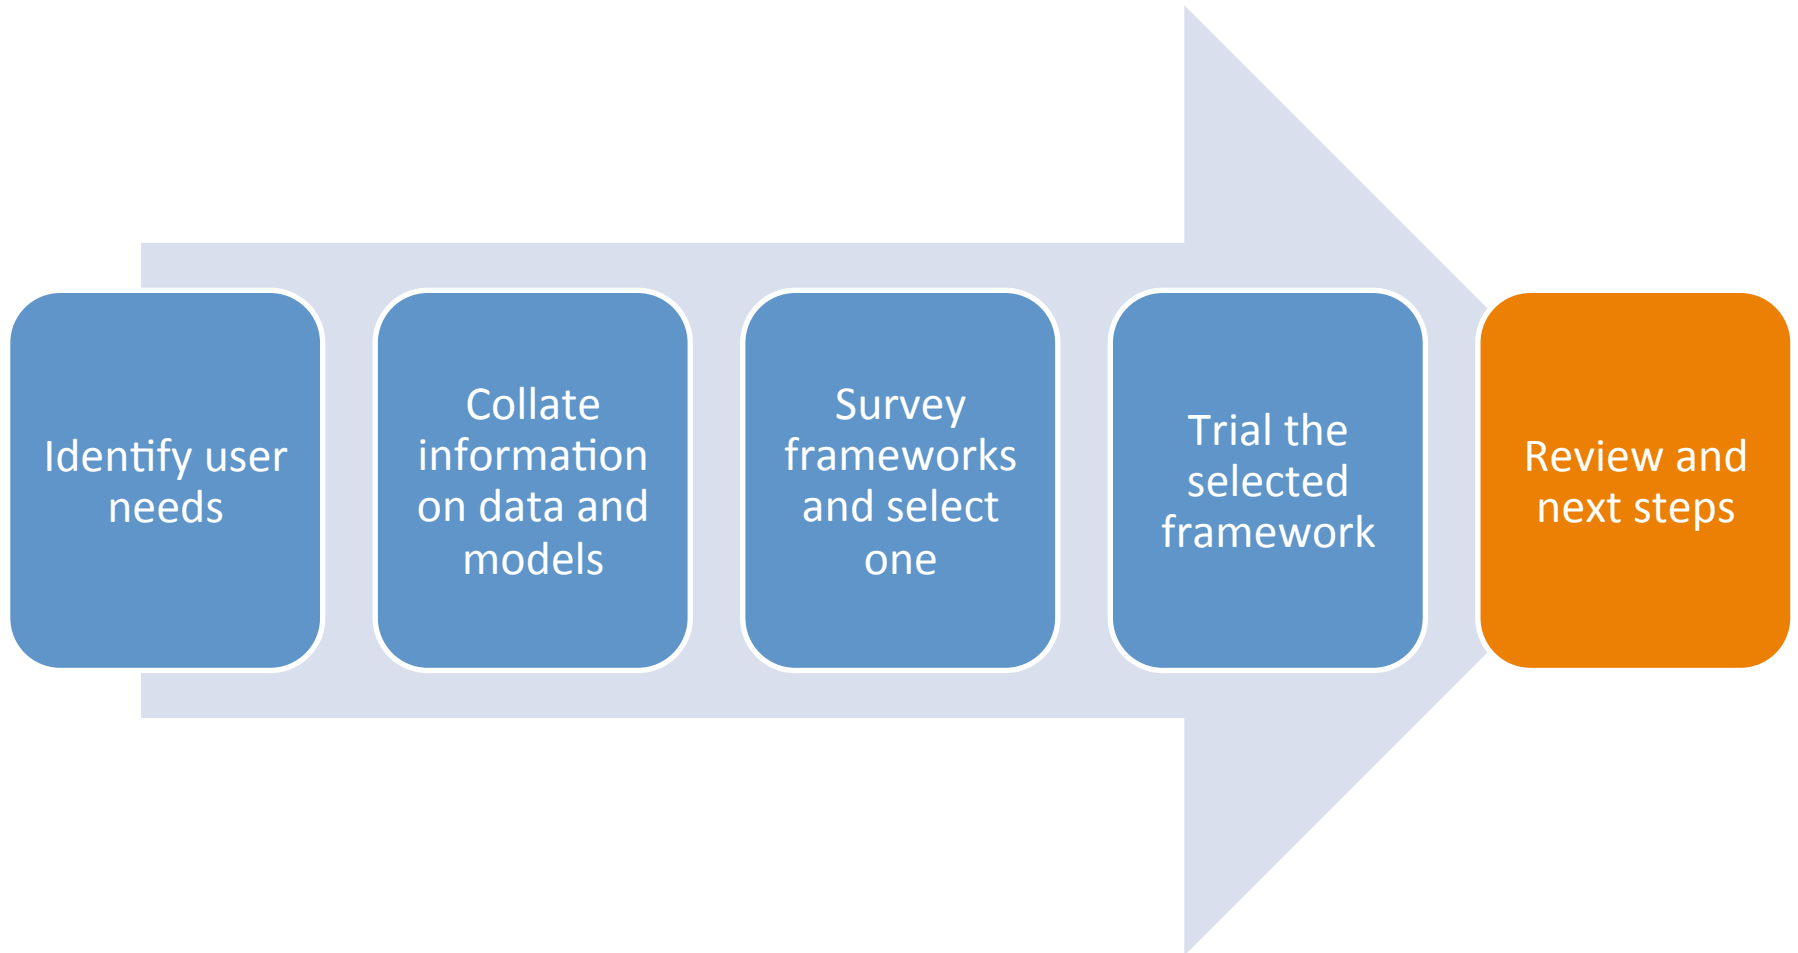

But...

- Requires moderate-high Java programming skills
- Difficult to link to complex .NET-based dll's
- User interfaces need to be built from scratch
- Limited geospatial and visualisation support
- No model repository

Unfinished business

- High-level users want to see a complex, polished, computationally-intensive application

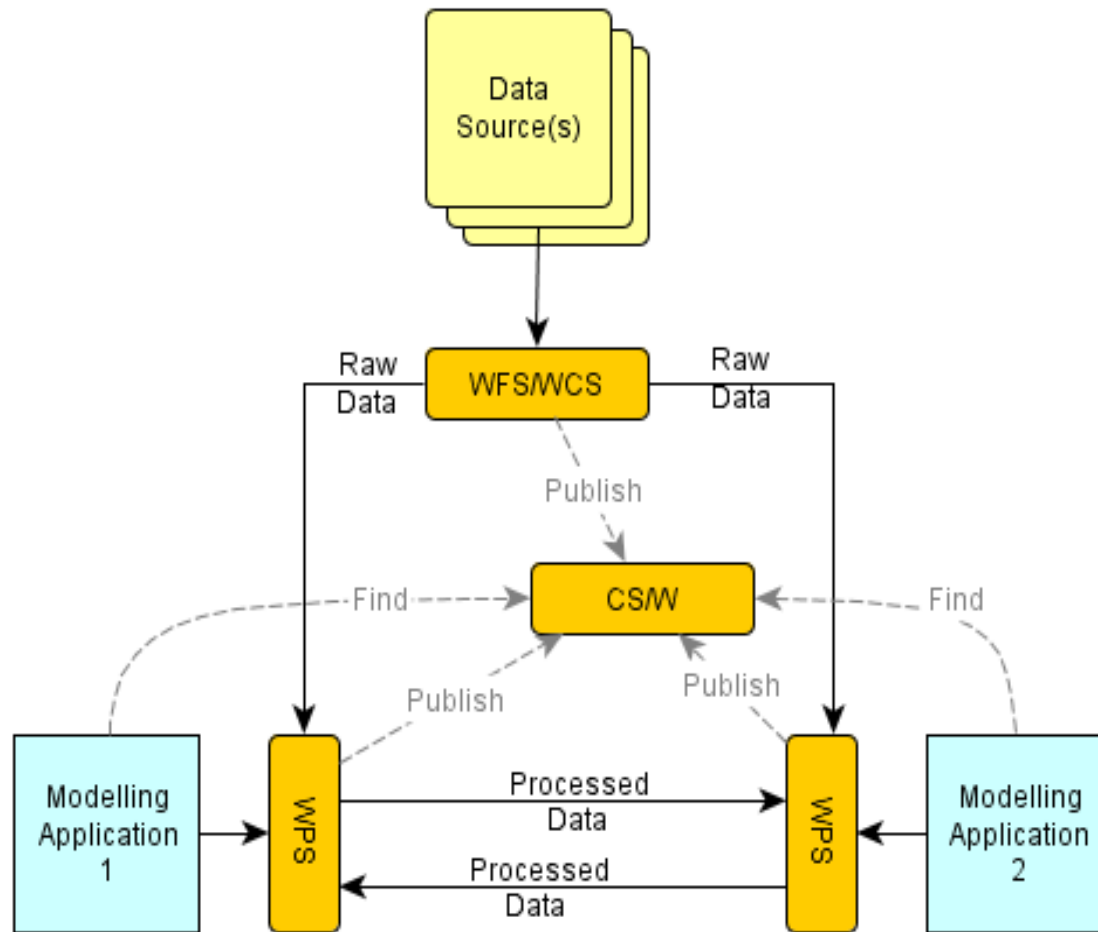

Stages of our investigations

Revisiting of alternatives

- OpenMI
 - Few OpenMI 2.0 –compliant models
 - Implementations of the standards are slow to appear
 - Frameworks such as OMS3 may adopt the standard
- Models as a service
 - Attractive for overcoming platform/language dependencies and IP barriers
 - Technologies immature (but developing quickly)

OGC SOS and WPS approaches

Next steps

- Build a full polished demonstration application of OMS3
- Continue on a staged path for web services
 - OGC data as OMS3 components
 - Web services as OMS3 components using WPS
 - Future web-centric framework?

Conclusions

- Initial trialling of OMS3 was promising, but more needed on user interfaces and domain-specific data structures
- Users need to see a polished local example before they will commit fully
- Expect to transition gradually to models-as-a-service, building on data interoperability
